

ESSMANN flat-roof drainage safety systems

ESSMANN's portfolio of products is rounded off by an advanced range of roof gullies for use in new buildings and renovation projects. By nature of their design, flat roofs are particularly exposed to the elements. Well-designed and effective drainage can significantly extend the service life of a flat roof.

ESSMANN offers the right system for all structural designs. ESSMANN gullies offer a number of benefits, including gully bodies made of impact-resistant polypropylene (PP), connections in various DN sizes, anti-backflow base bodies, optional heating by means of a 230 V connection, complementary accessories and simple installation. As well as flat roof drainage, combined drainage of balcony and terrace superstructures, for example, is also possible.
